

# Logo & Branding Admin Feature

Feature Implementation Report

May 2026 | Branch: feature/logo-branding-admin

Admin-editable logo and favicon — zero code, zero deploy.

Client uploads once. Site updates everywhere. Static fallback always in place.

This report documents the implementation of admin-editable logo and favicon management for the BJP Technologies website. Prior to this feature, the company logo and favicon were hardcoded as static files — replacing them required a developer, a code change, and a deployment. This feature moves that control entirely into the Django admin panel.

The client can now upload a new logo or favicon at any time from **Admin** → **Site Settings** → **Logo & Branding** with no developer involvement. The site continues to display the existing static logo until a new one is uploaded, so there is zero risk of a broken header during the transition.

## Key Decisions

### Single logo field, not two

An earlier consideration was to add two logo fields — one for dark backgrounds (navbar, footer) and one for light backgrounds. This was rejected because it places the burden on the client to upload and maintain two matching files every rebrand. A missed upload results in a mismatched header and footer.

Instead, a single logo field is used. The CSS filter `filter: brightness(0) invert(1)` applied to the `<img>` element in the navbar and footer converts any uploaded logo to white automatically. The client uploads once; the correct colour variant is rendered in all placements via CSS.

### Feature Implementation Report

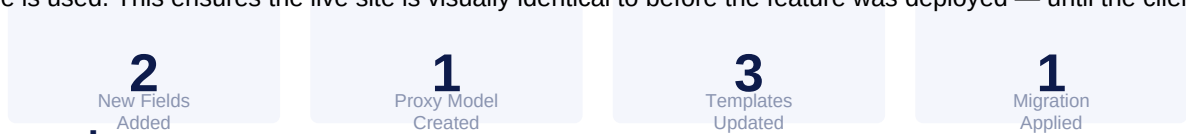

### FileField, not ImageField

May 2026 | Branch: `feature/logo-branding-admin`

Django's `ImageField` uses `Pillow` for validation. `Pillow` cannot decode SVG files, so uploading an SVG would be rejected even though SVG is the preferred logo format. A `FileField` with a custom validator is used instead, explicitly accepting SVG, PNG, and WebP while rejecting JPEG (no transparency support), GIF, BMP, and other non-web formats.

### Static file fallback

All three templates (navbar, footer, base.html) check `{% if company.logo %}` before rendering the uploaded file. If no logo has been uploaded, the existing static file is used. This ensures the live site is visually identical to before the feature was deployed — until the client chooses to upload.

## Files Changed

| File                                 | Action   | Purpose                                               |
|--------------------------------------|----------|-------------------------------------------------------|
| apps/core/validators.py              | Created  | validate_logo_file, validate_favicon_file             |
| apps/core/models.py                  | Modified | logo + favicon FileFields; LogoBrandingSettings proxy |
| apps/core/admin.py                   | Modified | LogoBrandingSettingsAdmin with live previews          |
| apps/core/migrations/0006_...        | Created  | DB columns for logo and favicon                       |
| config/settings/base.py              | Modified | Logo & Branding link in Unfold sidebar                |
| config/urls.py                       | Modified | Media serving in development (DEBUG only)             |
| apps/core/templates/core/navbar.html | Modified | Dynamic logo with static fallback                     |
| apps/core/templates/core/footer.html | Modified | Dynamic logo with static fallback                     |
| apps/core/templates/core/base.html   | Modified | Dynamic favicon with static fallback                  |

## Accepted File Formats

| Field   | Accepted Formats | Rejected Formats     | Reason for Restriction                                             |
|---------|------------------|----------------------|--------------------------------------------------------------------|
| Logo    | SVG, PNG, WebP   | JPEG, GIF, BMP, TIFF | JPEG has no transparency — logo background bleeds on dark navbar   |
| Favicon | PNG, ICO         | SVG, JPEG, GIF       | Browsers expect raster favicons; PNG/ICO are universally supported |

Validation is enforced server-side in `apps/core/validators.py`. Uploading a rejected format displays a clear error message in the admin panel before saving.

## How It Works

Both the navbar and footer now contain a conditional block:

## BJP TECHNOLOGIES (T) LIMITED

The CSS filter converts the uploaded logo to pure white, matching the existing static white logo on the dark navy header and footer backgrounds.

### Favicon — base.html

The <head> block checks for an uploaded favicon. If present, a single <link rel="icon"> tag points to the uploaded file. If absent, all three original static favicon sizes (32px, 64px, 256px apple-touch) remain in use.

### Admin preview

The Logo & Branding admin section renders a live preview immediately below the upload widget on the same row. The logo preview uses a navy (#0D1B4B) background so the client sees exactly how the logo will appear on the site — not on a white admin background that would be misleading for a white or light-coloured logo.

# Logo & Branding Admin Feature

## Feature Implementation Report

May 2026 - L Branch: feature/logo-branding-admin

Migration 0006\_add\_logo\_branding\_fields adds two nullable columns to the existing core\_sitesettings table:

| Column  | Type         | Default          | Nullable         |
|---------|--------------|------------------|------------------|
| logo    | VARCHAR(100) | — (empty string) | Yes (blank=True) |
| favicon | VARCHAR(100) | — (empty string) | Yes (blank=True) |

Both columns are non-destructive additions. No existing data is modified. The migration is safe to run on the live production database.

## Deployment Steps

After merging feature/logo-branding-admin → develop → main and the CI/CD pipeline completes, run the following on the cPanel server:

| Step | Command                                                    | Purpose                                            |
|------|------------------------------------------------------------|----------------------------------------------------|
| 1    | cd ~/bjp-technologies-web                                  | Navigate to project root                           |
| 2    | git pull origin main                                       | Pull the latest merged code                        |
| 3    | source ~/virtualenv/bjp-technologies-web/3.11/bin/activate | Activate virtualenv                                |
| 4    | python manage.py migrate                                   | Apply migration 0006 — adds logo + favicon columns |
| 5    | touch tmp/restart.txt                                      | Restart Passenger — picks up the new code          |

After the restart, navigate to Admin → Site Settings → Logo & Branding to upload the company logo and favicon. No collectstatic is required — uploaded files are served from MEDIA\_ROOT, not the static file pipeline.

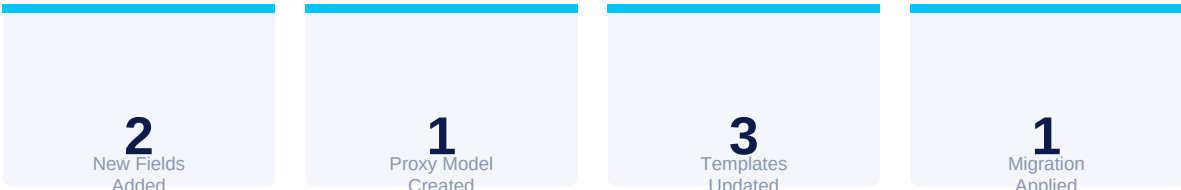

## Summary

| Item                    | Detail                                             |
|-------------------------|----------------------------------------------------|
| Feature                 | Admin-editable logo and favicon                    |
| Branch                  | feature/logo-branding-admin                        |
| Migration               | 0006_add_logo_branding_fields                      |
| New files               | apps/core/validators.py, migration file            |
| Modified files          | models.py, admin.py, base.py, urls.py, 3 templates |
| Tests                   | 67 / 67 passing — no regressions                   |
| Linting                 | ruff ✓ black ✓                                     |
| Visual change on deploy | None — static fallback until client uploads        |
